1650. GOTTSEGEN G. and KOROSSY S. III. Inn. Abt., Dermatol. Abt., Städt. István-Krankenh., Budapest. \*Zur nosologischen Stellung der Behçetschen Krankheit. The nosology of Behçet's disease DERM. WSCHR. 1956, 133/2 (33-36)

On the basis of a personal case, the differential diagnosis of Behçet's disease is discussed. This chronic disease is accompanied by the following symptoms: aphthae, iritis, genital ulcers, phlebitis, orchitis. However, of prominent importance is a severe, progressive involvement of the mesodermal layers of the eyes, which in the course of years leads to irreversible changes and blindness. The agent is shown to be a virus (not yet confirmed, abstr.). The endemic region of the affection is the area round the eastern part of the Mediterranean. Behçet's disease should be differentiated from benign ectodermoses which are accompanied by similar skin phenomena, take either an acute or a subacute course and involve exclusively the external epithelial layers of the eye (Stevens-Johnson's disease, ectodermosis erosiva pluriorificialis Flessinger-Rendu, Baader's dermatostomatitis, Lipschütz's ulcus vulvae acutum). 1392. EXPERIENCES WITH A THROMBOCYTOPENIA TEST IN INFECTIOUS ECZEMATOID DERMATITIS AFTER INJECTION OF STAPHYLOCOCCUS ANATOXIN - Erfahrungen mit durch Staphylokokkus-Anatoxin ausgelöstem Thrombozytopenie-Test bei kokkogenen Ekzemen - Korossy S. and Gózy M. Hautabt., Stephansspit, Budapest - ACTA ALLERG. (Kbh.) 1958, 12/1 (68-74) Tables 3

In 140 patients thrombocytopenia tests were made after injection of staphylococcus anatoxin. The test is said to be positive if the decrease of the number of thrombocytes is over 20% after one hour. Fifty-six of 72 infectious eczematoid dermatitis cases, i.e. 77.7%, yielded positive results. Only 7 out of 68 patients tested for control, i.e. 10.3%, could be said to be positive. The thrombocytopenia test was usually (in 25 out of 26 cases) positive within one hour after the injection of the antigen; therefore it is recommendable to perform the thrombocyte count after one hour. Changes in the pulse rate, the number of leucocytes and the qualitative blood picture showed no relation to the change in the thrombocyte count.

3257. STAPHYLOCOCCI ANATOXIN TREATMENT OF PATIENTS WITH ECZEMA CAUSED BY COCCI - Adatok coccogen ekzémás betegek staphylococcus-anatoxin kezeléséhez - Korossy S., Dóbiás Gy., Backhausz R. and Gózon M., István Kórház Bőrsztyánán és Humán Oltóanyagtermelő és Kutató Int.Közl., Budapest - ORV.HETIL. 1959, 100/4 (134-139) Graphs 4 Tables 6

Twenty-three patients with coccogenic eczema were treated with 2 staphylococci anatoxins of different activity; 18 of them were followed up for 2-3 yr. Eleven patients were completely cured, in 2 cases the result was doubtful and 5 cases were refractory. The importance of anatoxin treatment in the cases which responded favourably is considered to consist of the possibility of reducing the number of recurrences. In accordance with the reports published in the literature the anatoxins raised the  $\alpha$ -antitoxin titre of the serum, in correspondence with their antigen values. The antitoxin level was parallel neither to the intensity of the treatment nor to the results of both the skin tests carried out with anatoxin and the thrombocytopenic test. This leads to the conclusion that the  $\alpha$ -toxin is not the adequate antigen of eczema caused by cocci. The staphylococci anatoxins contain at least 3 antigens apart from the  $\alpha$ -anatoxin which may be considered responsible for the skin tests or the positive results of the thrombocytopenic test. In the  $\gamma$ -globulin solutions obtained from the mixed plasma of healthy individuals by means of gel diffusion analysis one antibody was found; in solutions obtained from the serum of patients with eczema due to cocci 0-4 antibodies were demonstrable, if staphylococci anatoxin was used as antigen. A strict parallelism was found between the cultivation of the staphylococci from the primary lesion of the skin and the clinical course of the disease.

"Practical Experiences Gained in the Course of the Examination and Treatment of 130 Patients with Chlorocid Allergy."

Budapest, Orvosi Hetilap, Vol 107, No 38, 18 Sep 66, pages 1790-1792.

Abstract: [Authors' Hungarian summary] Between 1958-64, 130 patients with Chlorocid allergy (C.a.) were examined by the authors. The allergic symptom can be precipitated by any form of application of the drug and it can not be inhibited even by the addition of hydrocortisone. The clinical picture is extremely manifold and it is not, by itself, characteristic either of the etiology or of the pathogenesis. Of the methods used for testing for the presence of C.a., the test using a 1.5 per cent salve was positive in 82 per cent of the cases, using an 0.5 mg per cent aqueous solution for i.c. test was positive in the form of a late-type reaction in 88 per cent of the cases and the oral provocation with 62.5 mg was positive in every case. According to the results of catamnestic studies, 1-6 years later on 39 patients, the skin application test was positive in 34 and negative in 5 cases. The late type i.c. skin reaction was positive in 31 and negative in 8 cases and, of the 13 cases which were positive before, only one became negative. The treatment of C.a. is identical with the procedures used both internally and locally in the treatment of allergic diseases. 3 Hungarian, 21 Western refer-

Aircraft antifriction bearings (aviatsionnyye podshipniki kacheniya), Moscow, Oberongiz, 1963, 339 p., illus., biblio., 4,800 copies printed.

TOPIC TAGS: antifriction bearing, jet engine, piston engine, lubrication, cooling, lubricant TsIATIM-221, lubricant VNIINP-222, bronze alloy BrAZhKts10-3-1.5, kerosene T-1, kerosene TS-1, kerosene T-2, nickel alloy EI 97h, bronze alloy BrAZhN10-4-4

PURPOSE AND COVERAGE: This book gives the experience in the design and use of antifriction bearings used in aircraft. The design and basic characteristics of bearings, ways of lubricating and cooling them, and the various factors affecting the operation of bearings are considered. The design of certain assemblies with bearings is treated. Methods of calculating bearings are given; the recommended methods of studying their typical defects and break downs and evaluating their condition during repairs are described. The book gives the required handbook information and various instructional materials on bearings. The book is intended for engineers-designers; it also will be of value to engineers and mechanics who service and repair machines.

TITLE: A method for calculating radial gaps in radial ball bearings with four- and three-point contact

SOURCE: Ref. zh. Mashinostroitel'nyye materialy, konstruktii i raschet detaley mashin. Gidroprivod, Abs. 9.48.356

REF SOURCE: Tr. Vses. n.-i. konstrukt.-tekhnol. in-ta podshipnik. prom-sti, v. 3(39), 1964, 75-83

TOPIC TAGS: ball bearing, bearing race, BEARING STABILITY

ABSTRACT: Small radial gaps in ball bearings with 4- and 3-point contact, working at high rotary velocities under primarily axial loads, may cause a 3-point contact of balls in the bearing. This leads to damaging of the races and rings. For this reason, the gaps in such bearings should be made sufficiently large to avoid this occurrence. A method for calculating the minimum necessary radial gaps in the bearings with a 4- and 3-point contact is recommended. [Translation of abstract]

Theoretical principles of radar (Teoreticheskiye osnovy radiolokatsii), Moscow, Izd-vo "Sovetskoye radio", 1964, 731 p. illus., biblio., index. Errata slip inserted. 12,600 copies printed.

TOPIC TAGS: radar

PURPOSE AND COVERAGE: This book is intended for students in the radio engineering faculties of higher technical educational institutions and can serve as an aid to engineers and graduate students specializing in radar. The book examines the principles of radar, methods of coordinate measurement and scanning and circuits for radar stations of three types: with an operator, a continuous computer installation and a digital computer. It presents the characteristics of radar signals with a consideration of the statistical regularities that occur in the reflection of radio waves, their propagation, and the presence of noise on the signal. The book describes methods of building optimal and near optimal receivers considering statistical, spatial and frequency time characteristics of the signal and interference. The book estimates the maximum capacities

Card 1/3

L 51052-65

ACCESSION NR AM5001148

of radar in detecting and measuring target coordinates. It gives a statistical evaluation of target position or trajectory on the basis of radar measurement data. In conclusion, the book describes methods of combating various types of interference and the operating principles of passive radar systems. All of the factual and numerical material is taken from the open domestic and foreign press.

Translation from: Referativnyy zhurnal. Elektrotehnika, 1959, Nr 4, p 105 (USSR)

AUTHOR: Korostelev, A. I.

TITLE: Ways for Improving Utilization of Capacity of TEZ Diesel Locomotives

PERIODICAL: Elektr. i teplovozn. tyaga, 1957, Nr 12, pp 4-6

ABSTRACT: The TEZ locomotive capacity decreases with an increase in its speed. Various ways exist for better capacity utilization: rational schemes and a control system, a greater number of traction-motor field-weakening steps, and changing the gear transmission ratio. The latter is the best method which raises the locomotive power at high speeds. With a lower rolling-stock weight, a lower transmission ratio would raise the power at 80 km/hr from 74.5 to 85.4% of the maximum power. It is recommended that the diesel locomotives be constructed with 3 transmission ratios: 4.41 for mountain lines, 3.6 for flatland lines, and 2.54 for passenger trains.

**AUTHOR:** Korostelev, G.N.

**TITLE:** On the Problem of the Start Currents in the Type-E Tubes (K voprosu o puskovykh tokakh v lampakh tipa "E")

**PERIODICAL:** Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika, 1958, Nr 4, pp 120-125 (USSR)

**ABSTRACT:** For the purpose of analysis it is assumed that the tube operates at comparatively low signals and that the attenuation and the space charge effect are negligible. The change in the propagation constant of the system is  $\Delta \Gamma = \Gamma - \Gamma_0$ , where  $\Gamma$  denotes the propagation constant of the wave in a system with an electron beam, while  $\Gamma_0$  is the propagation constant in a passive system. The phase change produced by the electron beam in one cell of the system can be expressed by:

$$d\varphi = i \frac{\int_V j E_z^* dv}{4P} \quad (1)$$

Card 1/5

06499

SOV/141-58-4-15/26

On the Problem of the Start Currents in the Type-E Tubes

where  $V$  is the volume occupied by the electron beam in the cell,  $E_z$  is the longitudinal component of the high-frequency electric field,  $j$  is the alternating component of the current density in the direction  $z$  and  $P$  is the energy flux passing through the cell. If  $j$  and  $E_z$  are constant in the interaction region, the change in the phase is given by Eq (2), where  $I$  is the alternating component of the total current. The power  $P$  can be expressed by Eq (3), where  $R_c$  is the coupling resistance. The change in the propagation constant is therefore given by Eq (4) or by Eq (5), where  $R_0$  is the resistance of a non-perturbed electron beam,  $I_0$  is the dc component of the total current and  $V_0$  is the potential corresponding to the electron velocity. If the system is periodic but linear and the electron trajectories are recti-linear, the field components can be expressed by Eq (6). The change in the alternating components of the current density is expressed by Eq (8), where  $\Gamma_0 = \omega/v_0$ ; the quantity  $\Gamma_0$  is referred to as the constant of the phase motion.

Card 2/5

06499  
SOV/141-58-4-15/26

On the Problem of the Start Currents in the Type-E Tubes

On the other hand, this change can be described by Eq (10). From Eq (8) and (10) it follows that  $\Gamma$  and  $\Gamma_0$  are related by Eq (11) or finally by Eq (12), where  $v_z$  denotes the full velocity of the electrons in the direction of the axis  $z$ . Since  $v_z$  is expressed by Eq (15), the final form of Eq (12) is that of Eq (18). If the roots of Eq (18) are denoted as  $\Gamma_1$  and  $\Gamma_2$ , the high-frequency field can be expressed by Eq (20), where the constants  $A_1$  and  $A_2$  are given by Eq (21). From the above it follows that the gain of the system can be expressed by Eq (22), where  $l$  denotes the length of the system. Eq (22) shows that the condition of self-excitation is given by Eq (23), where  $n = 0, 1, 2, \dots$ . If the currents of Eq (18) satisfy the oscillation condition given by Eq (23), they can be regarded as representing the starting currents for the tube. The currents are expressed by:

$$I_{0n} = \Gamma^2 (2n + 1)^2 \frac{V_0}{\Gamma_0^2 R_{c1}^2} \quad (24)$$

Card 3/5

06199

SOV/141-58-4-15/26

## On the Problem of the Start Currents in the Type-E Tubes

where  $V_0$  is the potential corresponding to the condition of a synchronism between the velocities of the wave in the system of the electron beam. If the system is in the form shown in Fig 1, the potential  $V_0$  can be expressed by Eq (25). The final formula for the starting currents is, therefore, given by Eq (26). The above analytical formulae were employed to evaluate the starting currents for a system having the following parameters: the height of the stubs  $h = 17$  mm, number of stubs  $N = 10$ ,  $L = 7.5$  mm,  $d = 1.5$  mm,  $l = 2.5$  mm,  $p = 4.5$  mm and  $l' = 70$  mm. The system was described by Leblond (Ref 6) and is illustrated diagrammatically in Fig 2. The coupling resistance of the system is given by Eq (27) or approximately by Eq (28). The scattering curve of the system is shown in Fig 3 and its coupling resistance as a function of  $\lambda$  is represented by Curve 6 in Fig 4. The same figure also shows the starting current as a function of  $\lambda$ . The paper contains 4 figures and 9 references, 3 of which are English.

TITLE: Influence of the "Sag" of the Electrode Potential on  
the Fluctuation of the Electron Beam in Centrifugal  
Electrostatic Focusing

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,  
Radiotekhnika, 1960, Vol. 5, No. 5, pp. 445 - 452

TEXT: The system of centrifugal electrostatic focusing is  
of importance in a number of ultrahigh-frequency devices such  
as spyratrons, helitrons or antiklystrons. One of the  
important problems in these devices is the fluctuation of the  
electron current and this has been investigated by Z.S. Chernov  
(Ref. 1 - Sb.Tr. IRE AN SSSR, 1956, No. 1, p. 7) and  
L.E. Bakhrakh (Ref. 6 - Radiotekhnika i elektronika, 1959,  
Vol. 4, No. 12, p. 2097) without taking into account the "sag"  
of the electrostatic potential in the slots of the periodic  
structure. In the following an attempt is made to derive  
an expression for the potential distribution in a cylindrical

Card 1/11

S/142/60/003/005/003/015  
E192/E582

Influence of the "Sag" ....

condenser which takes into account the surface irregularities of the internal or external cylinders and to evaluate the resulting fluctuations of the electron beam. The expression for the electrostatic potential distribution in the space  $r_1 \leq r \leq r_2$  can be found from the Laplace equation:

$$\frac{1}{r} \frac{\partial}{\partial r} r \frac{\partial V}{\partial r} + \frac{1}{r^2} \frac{\partial^2 V}{\partial \phi^2} = 0 \quad (1) .$$

The systems considered are illustrated in Figs 1a and 1b. The boundary conditions for the condenser of Fig. 1a are as follows:  $V_{r=r_1} = V_2$  for  $r = r_2$ ; on the other hand, for

$r = r_1$  the potential can be approximated by :

Card 2/11

24376

S/142/60/005/005/005/015

E192/E582

Influence of the "Sag" ....

$$V_{r=r_1}(\varphi) = V_1 - kV_\phi (1 - \cos N\varphi) .$$

In the above expression  $V_1$  represents the potential of the segmented structure,  $V_2$  is the potential of the external cylinder,  $V_\phi = V_1 - V_2$ ,  $N = 2\pi/\alpha$ ,  $\alpha$  is the angular distance between the centres of two neighbouring segments and  $k$  is the coefficient characterising the degree of "sag" of the electrostatic potential between the segments. The solution of Eq. (1) shows that the static potential in the cylindrical condenser containing the slots in the internal cylinder is in the form:

$$V(r, \varphi) = V_1 - \frac{V_\phi \ln r/r_1}{\ln r_2/r_1} - kV_\phi \frac{\ln r_2/r}{\ln r_2/r_1} + kV_\phi \frac{(r/r_1)^N - (r_2/r)^N}{(r_2/r_1)^N - (r_1/r_1)^N} \cos N\varphi . \quad (2) .$$

Card 3/11

24376

3/142/60/003/005/003/015  
2192/E382

Influence of the "Sag" ....

The last two terms in Eq. (2) characterise the "sag" of the potential in the vicinity of the slots and these terms rapidly decrease with increasing  $r$ . It is also shown that in the case when the external cylinder of the condenser is slotted (Fig. 1E), the potential distribution is described by:

$$\begin{aligned} V_{r=r_1} &= V_1; V_{r=r_2} = \\ &= V_2 + kV_\phi(1 - \cos N\varphi). \\ V(r, \varphi) &= V_1 - \frac{V_\phi \ln r/r_1}{\ln r_2/r_1} + \\ &\quad + kV_\phi \frac{\ln r/r_1}{\ln r_2/r_1} + \quad (3) \\ &\quad + kV_\phi \frac{(r/r_1)^N - (r_2/r_1)^N}{(r_1/r_2)^N - (r_2/r_1)^N} \cdot \cos N\varphi. \end{aligned}$$

Card 4/11

24376

S/142/60/003/005/003/015  
E192/E382

Influence of the "Sag" ....

It is seen that the second and the fourth terms of these equations decrease rapidly with decreasing  $r$ . For the purpose of determining the fluctuations of the electron beam due to the potential "sag", it is assumed that the beam thickness is finite and that the electrons of the outer boundary of the beam move along an equilibrium circular trajectory having a radius  $r = r_b$ . It is shown that <sup>fluctuations</sup> electron at the inner boundary can be described in the following form:

$$\frac{d^2 r}{d\varphi^2} = \frac{r_a^4}{r^3} - \frac{r_a^2 \ln r_2 / r_1}{(1 + 2 \ln r_b / r_a)} \left[ \frac{1-k}{r \ln r_2 / r_1} - \frac{kN}{r_2} \frac{(r/r_2)^{N-1} + (r_2/r)^{N+1}}{(r_1/r_2)^N - (r_2/r_1)^N} \cos N\varphi \right]. \quad (7).$$

In the case of small fluctuations such that  $r = r_a (1 + \Delta_1)$ , where  $\Delta_1$  is less than unity and  $r_a \Delta_1$  is less than  $r_a \alpha$ , Eq. (7) can be linearised and approximately written as:

Card 5/11

21376

S/142/60/003/005/003/015  
E192/E382

Influence of the "Sag" ....

$$\frac{d^2 \Delta_l}{d\varphi^2} + (a_1 - b_1 \cos N\varphi) \Delta_l = d_1 \cos N\varphi + c_1, \quad (8)$$

where

$$\begin{aligned} a_1 &= 3 - \frac{1-k}{1+2\ln r_0/r_s}; & c_1 &= 1 - \frac{1-k}{1+2\ln r_0/r_s}; \\ b_1 &= \frac{r_s}{r_2} \frac{kN \ln r_2/r_1}{(1+2\ln r_0/r_s)} \left[ N \frac{(r_s/r_2)^{N+1} - (r_2/r_s)^{N+1}}{(r_1/r_2)^N - (r_2/r_1)^N} - \right. \\ &\quad \left. - \frac{(r_s/r_2)^{N-1} + (r_2/r_s)^{N+1}}{(r_1/r_2)^N - (r_2/r_1)^N} \right]; \\ d_1 &= r_s/r_2 \frac{kN \ln r_2/r_1}{(1+2\ln r_0/r_s)} \frac{(r_s/r_2)^{N+1} + (r_1/r_s)^{N+1}}{(r_1/r_2)^N - (r_2/r_1)^N}. \end{aligned} \quad (8a)$$

Similarly, on the basis of Eq. (3), it is possible to obtain a differential equation for the fluctuation of the external boundary of the beam when the latter moves in the vicinity of the external slotted cylinder. In this case, the solution is in the form:

Card 6/11

Influence of the "Sag" ....

S/142/60/003/005/003/015  
E192/E382

where

$$\frac{d^2 \Delta_e}{d\varphi^2} + (a_2 - b_2 \cos N\varphi) \Delta_e = d_2 \cos N\varphi + c_2, \quad (9)$$

$$a_2 = 3 - \frac{1-k}{1-2 \ln r_b/r_a}, \quad c_2 = 1 - \frac{1-k}{1-2 \ln r_b/r_a}; \quad (9a)$$

$$b_2 = \frac{r_b k N \ln r_b/r_a}{r_a (1+2 \ln r_b/r_a)} \left[ N \frac{(r_b/r_a)^{N-1} - (r_a/r_b)^{N+1}}{(r_a/r_b)^N - (r_b/r_a)^N} - \frac{(r_b/r_a)^{N-1} + (r_a/r_b)^{N+1}}{(r_a/r_b)^N - (r_b/r_a)^N} \right]; \quad (9b)$$

$$d_2 = \frac{r_b}{r_a} \frac{k N \ln r_b/r_a}{(1-2 \ln r_b/r_a)} \frac{(r_b/r_a)^{N-1} + (r_a/r_b)^{N+1}}{(r_a/r_b)^N - (r_b/r_a)^N}. \quad (9c)$$

Eqs. (8) and (9) were solved by means of a computer and the results illustrating the dependence of the maximum fluctuation of the internal boundary of the beam on the

Card 7/11

Influence of the "Sag" ....

S/142/60/003/005/003/015  
E192/E382

ratio  $r_b/r_a$  for various values of  $k$  are given in Fig. 4; oscillograms of the fluctuations of the internal boundary of the electron beam for  $a - k = 0.1$  and  $b - k = 0.4$  (with  $r_b/r_a = 1.1$ ) are given in Fig. 6. Similar graphs were determined for the fluctuation of the external boundary for the system with the slotted external cylinder. From the above data, it is concluded that the fluctuation amplitude  $|\Delta_i|_{\max}$  increases monotonically with increasing coefficient  $k$ , which characterises the "sag" of the potential in the slots of the internal cylinder. On the other hand, fluctuation of the external boundary of the beam is first reduced as  $k$  increases and then gradually increases; there exists an optimum value of  $k$  at which  $|\Delta_e|_{\max}$  is a minimum. The above calculations also show that in order to reduce the fluctuations of the electron beam in the systems of centrifugal focusing, it is advisable to employ periodic structures which are external to the beam. The author expresses

AUTHOR: Korostelev, G. N.

TITLE: The effect of space charge on beam scalloping in  
E-type tubes

PERIODICAL: Radiotekhnika i elektronika, v.8, no.1, 1963, 116-126

TEXT: The purpose of the paper is to derive analytical formulas suitable for determining the optimum conditions for the electrostatic focusing of helical beams of rectangular cross-section. The coupling between the beam and the rf field is obtained through slots which are either outside the electron beam or enclosed by it. The motion of electrons is calculated on the basis of a two-dimensional model for two alternative arrangements. Laplace's and Poisson's equations are solved in the particle-free region and for the beam respectively, taking account of the potential variation due to the longitudinal slots. Neglecting thermal velocities and the effect of slots on the azimuthal motion of the electrons and assuming a laminar flow, the trajectory of the outer (inner) elec-

Card 1/3

The effect of space ...

S/109/63/008/001/015/025  
D266/D308

tron does not appreciably differ from  $r_0(r_a)$ , the equation of motion can be written in the form of an inhomogeneous Mathieu equation. This is solved by varying the constant of the homogeneous solution and the regions of stability are determined. Scalloping depends on 3 parameters,  $k$  - characterizing the intrusion of electric field through the slots,  $h/s$  - depending on space charge, geometry and voltage difference between the electrodes, and  $y = r_0/r_a$ . In general, scalloping is smaller for smaller  $k$  and smaller  $y$  (both cases) whilst larger  $h/s$  is more favorable for the case of inner slots and smaller  $h/s$  for that of outer slots. The maximum permissible current is also calculated on the condition of no interception by the electrodes. The effect of rf fields and currents on the focusing is not included in the analysis, but the author notes that they might cause significant distortion on the beam. There are 7 figures.

of centrifugal-electrostatic focusing 25

SOURCE: IVUZ. Radiotekhnika, v. 8, no. 1, 1965, 99-103

TOPIC TAGS: centrifugal electrostatic focusing, electron focusing, shf device

ABSTRACT: It is theoretically proven that, while the effect of the thermal velocities of electrons on the constant electron speed in a shf device is negligible, the effect of the transverse components of the thermal velocities upon the radial movements of electrons can be considerable; the radial displacements determine the pulsation of the electron stream in centrifugal-electrostatic focusing devices. It is shown that conditions are possible when the thermal velocities may change the pulsation parameter by as much as 30%. The derived formulas are intended for

TITLE: Removal from storage of engineer vehicles

SOURCE: Tekhnika i vooruzheniye, no. 5, 1965, 74-75

TOPIC TAGS: equipment storage technique, storage battery, motor vehicle

ABSTRACT: An exercise in restoring vehicles to combat readiness after long storage at low temperatures showed that the restoration of vehicles to combat readiness is about 20-25 times faster than the preparation of same for storage. It also showed that the installation of storage batteries, filling up with antifreeze, starting and warming-up of engines, and checking of instruments takes about half as long as as the preparation of the storage batteries. The results of this exercise lead to the conclusion that 1) special buildings for storing and charging storage batteries, and for electrolyte, antifreeze, solvent, and wiper stock be erected near the parking space of maintenance units in charge of long storage of large numbers of vehicles,
